Abstract
This presentation will give a comprehensive introduction about the development of Space Solar Power Satellite (SSPS) in China. Firstly, a novel design called OMEGA SSPS innovative design project is presented and its advantages over the existed projects of the world are given in details. Secondly, the corresponding theory and technologies such as the high efficiency solar power collection, new optic-electric transfer, overall thermal problem solution, wireless microwave energy transfer and the corresponding transferring antenna in space and rectenna in the earth, and so on. Thirdly, the numerical simulation results of the above points are shown to demonstrate the project. Forth, the practical experiment results and prototype are discussed. And finally, the next plan and road map of Chinese development of SSPS are given too.

Abstract
Automated Guided Vehicle (AGV) is an autonomously moving electric vehicle (EV) for carrying materials in a factory. AGV is capable of increasing the productivity, recharging the batteries is required after use, and it interrupts the production process in the plant. Therefore, AGV requires the battery charging during the motion for further improvement in the productivity and usability. This presentation introduces a non-beam wireless power transfer (WPT) system based on parallel feeder line. The proposed WPT is capable of sending power to the moving vehicles alongside the feeder line. The experimental results showed that the developed WPT could provide the electrical power to the moving vehicle in more than 100 meters of the feeding area. In this talk, we also show a WPT with multiple transmitters and receivers, or, a multiple-input-multiple-output (MIMO) WPT system. The proposed MIMO-WPT is capable of improving the transmission efficiency. Also, it is more robust in position misalignment of the couplers.
