1. Balanced (C_5, C_{16}) -Foil Designs

Let K_n denote the complete graph of n vertices. Let C_5 and C_{16} be the 5-cycle and the 16-cycle, respectively. The (C_5, C_{16}) - $2t$ -foil is a graph of t edge-disjoint C_5 's and t edge-disjoint C_{16} 's with a common vertex. When K_n is decomposed into edge-disjoint sum of (C_5, C_{16}) - $2t$ -foils and every vertex of K_n appears in the same number of (C_5, C_{16}) - $2t$ -foils, we say that K_n has a balanced (C_5, C_{16}) - $2t$ -foil decomposition. This decomposition is to be known as a balanced (C_5, C_{16}) -foil design.

Theorem 1. K_n has a balanced (C_5, C_{16}) - $2t$ -foil design if and only if $n \equiv 1 \pmod{42t}$.
