Abstract - A $\pm 45^\circ$ slant polarization (SP) reconfigurable omnidirectional antenna and a circular polarization (CP) reconfigurable omnidirectional antenna are proposed. 16 PIN diodes are employed for the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna while 8 PIN diodes are used for the CP reconfigurable omnidirectional antenna. Simulation and experimental results are demonstrated.

Index Terms —Polarization reconfigurable antenna, omnidirectional antenna.

1. Introduction

In recent years, a number of polarization reconfigurable antennas have been developed. But most of those are unidirectional antennas [1]–[4]. An omnidirectional circular polarization (CP) reconfigurable antenna is presented in [5] with 48 PIN diodes. In this paper, a $\pm 45^\circ$ slant polarization (SP) reconfigurable omnidirectional antenna with 16 PIN diodes and a CP reconfigurable omnidirectional antenna with 8 PIN diodes are proposed.

2. $\pm 45^\circ$ SP Reconfigurable Omnidirectional Antenna

The configuration of a $\pm 45^\circ$ SP reconfigurable omnidirectional antenna is depicted in Fig. 1. The $\pm 45^\circ$ SP omnidirectional antenna consists of 4 crossed dipoles and a feeding network. 4 PIN diodes are introduced in each crossed dipole. When PIN diodes 1 and 3 are switched on and PIN diodes 2 and 4 switched off, $+45^\circ$ SP is obtained; otherwise -45° SP is implemented. A prototype, the S-parameter, and the radiation pattern of the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna are shown in Figs. 2, 3, and 4, respectively.

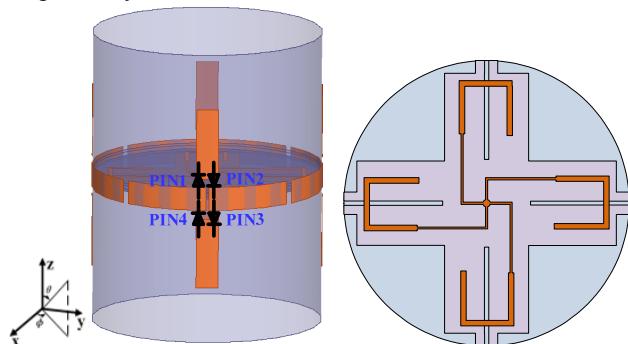

Fig. 1. Configuration of the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna.

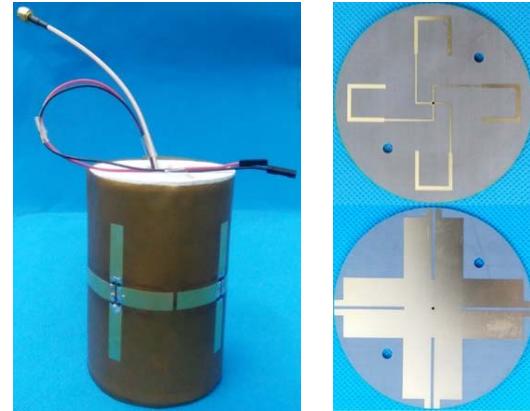

Fig. 2. A prototype of the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna.

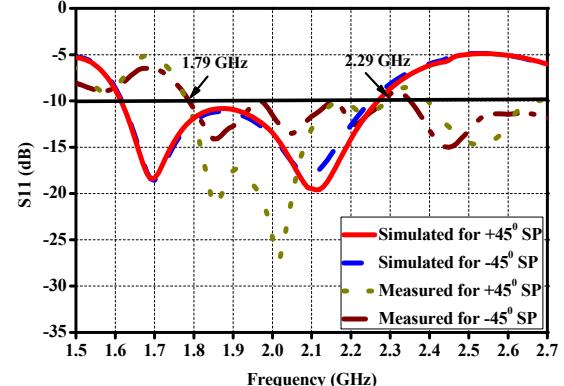

Fig. 3. S-parameter of the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna.

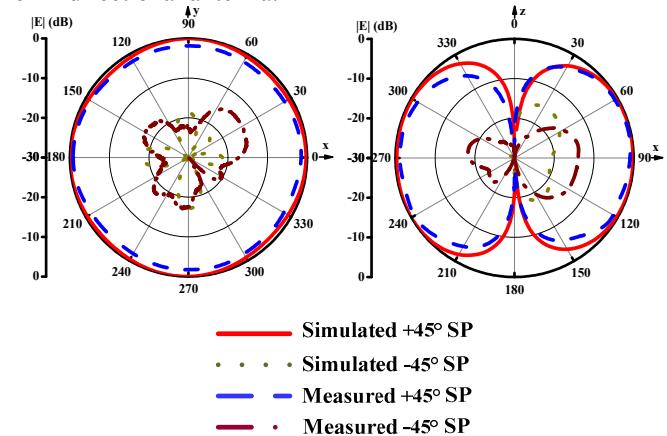

Fig. 4. Radiation pattern of the $\pm 45^\circ$ SP reconfigurable omnidirectional antenna for $+45^\circ$ SP.

3. CP Reconfigurable Omnidirectional Antenna

The configuration of a CP reconfigurable omnidirectional antenna is illustrated in Fig. 5. The CP omnidirectional antenna consists of 4 rectangular loops, a metallic cylinder, and a feeding network. 2 PIN diodes are inserted in each rectangular loop. When PIN diode 1 is switched on and PIN diodes 2 switched off, left-handed CP (LHCP) is achieved; otherwise right-handed CP (RHCP) is realized. A prototype, the S-parameter, axial ratio, and the radiation pattern of the CP reconfigurable omnidirectional antenna are demonstrated in Figs. 6, 7, 8, and 9, respectively.

4. Conclusion

A $\pm 45^\circ$ SP reconfigurable omnidirectional antenna and a CP reconfigurable omnidirectional antenna are developed. 16 PIN diodes are used for the $\pm 45^\circ$ SP reconfigurable antenna while 8 PIN diodes are employed for the CP reconfigurable antenna. These polarization reconfigurable omnidirectional antennas may find applications in polarization diversity for wireless communications.
