# A Note on Riemannian Optimization Methods on the Stiefel and the Grassmann Manifolds 

Yasunori Nishimori<br>National Institute of Advanced Industrial Science and Technology (AIST), AIST Tsukuba Cental 2, 1-1-1, Umezono, Tsukuba, Ibaraki 305-8568, Japan Email: y.nishimori@aist.go.jp

#### Abstract

We prove the updating rules given by the Riemannian optimization methods on the Stiefel and the Grassmann manifolds coincide if the target function for optimization on the Stiefel manifold has a symmetry so that it is regarded as a function on the Grassmann manifold. The Grassmann condition is encapsulated in this symmetry. Therefore we do not need the formulas for the Grassmann manifold separately; all of them, the natural gradient method, the conjugate gradient method, and the Newton method reduce to the counterparts for the Stiefel manifold.

## 1. Introduction

Riemannian optimization methods on the Stiefel and the Grassmann manifolds based on geodesics attracted attention recently and have been used among several research communities such as neural networks [7],[8],[9], pattern recognition [5], computer vision [6], numerical analysis $[1],[3]$, and so on. Although most authors concentrate on either manifold, the Stiefel manifold $[7],[8],[9]$, or the Grassmann manifold [1],[5], in their seminal paper [3], Edelman-Arias-Smith developed formulas for both manifolds. The expressions of their formulas for the Grassmann manifold are, however, very different from the counterparts for the Stiefel manifold. The main aim of this paper is to illustrate the updating rules given by the Riemannian optimization methods on the Stiefel and the Grassmann manifolds actually coincide if the target function for optimization on the Stiefel manifold has a symmetry so that it is regarded as a function on the Grassmann manifold. The fact that the Stiefel manifold is a principal bundle over the Grassmann manifold is exploited. As far as we know, this result has not been stated in the previous literature.

### 1.1. Riemannian Optimization Method

In this paper we are concerned about the two manifolds: the Stiefel manifold and the Grassmann manifold. The Stiefel manifold is described by orthogonal rectangular matrices of the following form:

$$
\begin{equation*}
\left\{W \in \mathbb{R}^{n \times p} \mid W^{\top} W=I_{p}\right\}, n \geq p \tag{1}
\end{equation*}
$$

We denote this set by $\operatorname{St}(n, p)$. The case where $n=p$ is called the orthogonal group and is denoted as $O(n)$. In contrast, the Grassmann manifold only pays attention to the subspace spanned by the column vectors of $W$. By introducing the following equivalence relation $\sim$

$$
\begin{equation*}
W_{2} \sim W_{1} \Longleftrightarrow \exists R \in O(p), \text { s.t. } W_{2}=W_{1} R \tag{2}
\end{equation*}
$$

the Grassmann manifold $\operatorname{Gr}(n, p)$ can be regarded as the quotient space $\operatorname{St}(n, p) / \sim$. The Riemannian optimization methods were proposed to solve optimization problems posed on a manifold $M$ such as $\operatorname{St}(n, p)$ or $\operatorname{Gr}(n, p)$ :
iteratively find $\arg \min _{M} f(W)$,
where $f$ is a real-valued smooth function on $M$. (3)
Conventional optimization techniques seek for updated points additively. For instance, the natural gradient method [2] proceeds as follows.

$$
\begin{equation*}
W_{k+1}=W_{k}-\eta \operatorname{grad}_{W} f\left(W_{k}\right) \tag{4}
\end{equation*}
$$

where $\operatorname{grad}_{W} f\left(W_{k}\right)$ is the Riemannian (natural) gradient defined by a Riemannian metric $g$ on $M$, and $\eta$ is a learning constant. This updated point $W_{k+1}$ does not always stay on the manifold $M$, while the Riemannian optimization methods update a point on a manifold along a geodesic, therefore the updated points always satisfy the manifold constraint and the trajectory of the updated points is stable. A geodesic is an extension of a straight line in the Euclidean space to a manifold $M$ and it is determined by a Riemannian metric $g$ on $M$. We denote the geodesic equation on $M$ emanating from $W \in M$ in direction to $V \in T_{W} M$ by $\varphi_{M}(W, V, t)$, which is a solution to the following equation:

$$
\begin{equation*}
\frac{d^{2} \gamma^{i}(t)}{d t^{2}}+\Gamma_{j k}^{i} \frac{d \gamma^{j}(t)}{d t} \frac{d \gamma^{k}(t)}{d t}=0(1 \leq i \leq \operatorname{dim} M) \tag{5}
\end{equation*}
$$

where $\varphi_{M}(W, V, t)=\left(\gamma^{1}(t), \ldots \gamma^{\operatorname{dim} M}(t)\right)$ in local coordinates of $M, \Gamma_{j k}^{i}=\frac{1}{2} \sum_{l=1}^{\operatorname{dim} M} g^{i l}\left(\partial_{j} g_{k l}+\partial_{k} g_{l j}-\partial_{l} g_{j k}\right)$, $g_{i j}=g\left(\frac{\partial}{\partial x_{i}}, \frac{\partial}{\partial x_{j}}\right), g^{i j}$ is the inverse of $g_{i j}$. By using this notation, the updating rules for three Riemannian optimization methods over a manifold $M$ are described as follows [3].

- gradient descent method

$$
W_{k+1}=\varphi_{M}\left(W_{k},-\operatorname{grad}_{W_{k}} f, \eta\right)
$$

- Newton's method

$$
W_{k+1}=\varphi_{M}\left(W_{k}, \operatorname{Hess}_{W_{k}} f^{-1}\left(-\operatorname{grad}_{W_{k}} f\right), 1\right)
$$

- conjugate gradient method (due to FletcherReeves)

$$
\begin{align*}
H_{0} & =-\operatorname{grad}_{W_{0}} f \\
t_{\min }^{k} & =\arg \min _{t} f\left(\varphi_{M}\left(W_{k}, H_{k}, t\right)\right) \\
W_{k+1} & =\varphi_{M}\left(W_{k}, H_{k}, t_{\min }^{k}\right), \\
H_{k+1} & =-\operatorname{grad}_{W_{k+1}} f+\gamma_{k+1} \Pi H_{k} \tag{6}
\end{align*}
$$

where $\Pi H_{k}$ is the parallel transportation vector of $H_{k}$ to $W_{k+1}$ along $\varphi_{M}\left(W_{k}, H_{k}, t\right)$.

$$
\begin{equation*}
\gamma_{k}=\frac{g\left(\operatorname{grad}_{W_{k}} f, \operatorname{grad}_{W_{k}} f\right)}{g\left(\operatorname{grad}_{W_{k-1}} f, \operatorname{grad}_{W_{k-1}} f\right)} \tag{7}
\end{equation*}
$$

Here we summarize the geodesic formulas and relevant facts necessary to describe the updating rules for the Stiefel and the Grassmann manifolds. We use the following Riemannian metrics:

$$
\begin{align*}
g_{W}^{\mathrm{St}(n, p)}(X, Y) & =\operatorname{tr}\left\{X^{\top}\left(I-\frac{1}{2} W W^{\top}\right) Y\right\}  \tag{8}\\
g_{W}^{\operatorname{Gr}(n, p)}(X, Y) & = \\
\operatorname{tr} & \left\{X^{\top} Y\right\}, \text { Euclidean metric. } \tag{9}
\end{align*}
$$

Together with the tangent space structures:

$$
\begin{align*}
& V_{1} \in T_{W} \operatorname{St}(n, p) \Longleftrightarrow \\
& W^{\top} V_{1} \text { is skew symmetric }  \tag{10}\\
& V_{2} \in T_{W} \operatorname{Gr}(n, p) \Longleftrightarrow W^{\top} V_{2}=0 \tag{11}
\end{align*}
$$

the natural gradients are expressed as:

$$
\begin{align*}
\operatorname{grad}_{W}^{\mathrm{St}(n, p)} f & =\nabla f(W)-W \nabla f(W)^{\top} W  \tag{12}\\
\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f & =\nabla f(W)-W W^{\top} \nabla f(W) \tag{13}
\end{align*}
$$

First, we present the geodesic formulas obtained by Edelman-Arias-Smith [3].
The geodesic emanating from $W \in \operatorname{St}(n, p)$ in direction $V \in T_{W} \operatorname{St}(n, p)$ is given by the curve

$$
\begin{equation*}
W(t)=W M(t)+Q N(t) \tag{14}
\end{equation*}
$$

where

$$
\begin{equation*}
Q R:=K=\left(I-W W^{\top}\right) V \tag{15}
\end{equation*}
$$

is the compact $Q R$ decomposition of $K(Q: n \times p$, $R: p \times p)$ and $M(t)$ and $N(t)$ are $p \times p$ matrices given by the matrix exponential

$$
\binom{M(t)}{N(t)}=\exp t\left(\begin{array}{cc}
A & -R^{\top}  \tag{16}\\
R & O
\end{array}\right)\binom{I_{p}}{O}
$$

where $A=W^{\top} V$. The geodesic on the Grassmann manifold starting from $W \in \operatorname{Gr}(n, p)$ with $V \in T_{W} \operatorname{Gr}(n, p)$ is expressed as:

$$
W(t)=\left(\begin{array}{ll}
W S R \tag{17}
\end{array}\right)\binom{\cos \Sigma t}{\sin \Sigma t} S^{\top}
$$

where $R \Sigma S^{\top}$ is the compact singular value decomposition of $V$.

$$
\begin{align*}
& \cos \Sigma=\left(\begin{array}{ccc}
\cos \sigma_{1} & & 0 \\
& \ddots & \\
0 & \ddots & \cos \sigma_{p}
\end{array}\right), \\
& \text { where } \Sigma=\left(\begin{array}{ccc}
\sigma_{1} & & 0 \\
& \ddots & \\
0 & & \sigma_{p}
\end{array}\right) \tag{18}
\end{align*}
$$

Stating their formulas, we instead utilize our formulas obtained in [8], which give geometrically simpler interpretations and are easier to analyze .

$$
\begin{gather*}
\varphi_{\mathrm{St}(n, p)}\left(W,-\operatorname{grad}_{W}^{\operatorname{St}(n, p)} f, t\right)= \\
\exp \left(-t\left(\nabla f(W) W^{\top}-W \nabla f(W)^{\top}\right)\right) W  \tag{19}\\
\varphi_{\operatorname{St}(n, p)}(W, V, t)= \\
\exp \left(t\left(D W^{\top}-W D^{\top}\right)\right) W  \tag{20}\\
\text { where } D=\left(I-\frac{1}{2} W W^{\top}\right) V  \tag{21}\\
\varphi_{\operatorname{Gr}(n, p)}\left(W,-\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f, t\right)= \\
\exp \left(-t\left(\nabla f(W) W^{\top}-W \nabla f(W)^{\top}\right)\right) W  \tag{22}\\
\varphi_{\operatorname{Gr}(n, p)}(W, V, t)= \\
\exp \left(t\left(V W^{\top}-W V^{\top}\right)\right) W \tag{23}
\end{gather*}
$$

## 2. Reduction of the Grassmann formula to the Stiefel formula

In this section we prove the main result:
if $f: \operatorname{St}(n, p) \rightarrow \mathbb{R}$ has a $O(p)$-symmetry, i.e.
$f(W R)=f(W)$ for all $W \in \operatorname{St}(n, p), R \in O(p)$,
the updating rules given by the gradient descent, the conjugate gradient method (due to Fletcher-Reeves), and the Newton method over the Stiefel manifold coincide with those over the Grassmann manifold respectively.

Proof: Let us denote the smooth curve over the orthogonal group $O(p)$ passing through the identity by $c(t)$.

$$
\begin{equation*}
c(t):[-a, a] \longmapsto O(p), \quad c(0)=I \tag{25}
\end{equation*}
$$

Differentiating the relation $c(t) c(t)^{\top}=I_{p}$ at $I_{p}$, we get

$$
\begin{equation*}
c^{\prime}(0) c(0)^{\top}+c(0)\left(c(0)^{\prime}\right)^{\top}=0 \tag{26}
\end{equation*}
$$

Thus $c^{\prime}(0)=X$ is a skew symmetric matrix. We next consider $W c(t)$, which is a curve on $\operatorname{St}(n, p)$ passing
through $W$. It follows from the definition of gradient that

$$
\begin{equation*}
\left\langle W c^{\prime}(0), \nabla_{W} f\right\rangle=\left(W c^{\prime}(0)\right) f^{1} \tag{27}
\end{equation*}
$$

Because of the condition (24), $f$ takes the same value at $W c(t)$ :

$$
\begin{equation*}
f(W c(t))=f(W) \tag{28}
\end{equation*}
$$

Therefore, $W c^{\prime}(t) f=\left.\frac{d}{d t} f(W c(t))\right|_{t=0}=0 \Longleftrightarrow$

$$
\begin{align*}
& \left\langle W X, \nabla_{W} f\right\rangle= \\
& \quad \operatorname{tr}\left((W X)^{\top} \nabla_{W} f\right)=\operatorname{tr} X^{\top} W^{\top} \nabla_{W} f=0 \tag{29}
\end{align*}
$$

for all $X$ : skew symmetric matrix. It follows that $W^{\top} \nabla_{W} f$ is symmetric. Hence

$$
\begin{equation*}
W\left(\nabla_{W} f\right)^{\top} W=W W^{\top} \nabla_{W} f \tag{30}
\end{equation*}
$$

which leads to $\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f=\operatorname{grad}_{W}^{\mathrm{St}(n, p)} f$. Thus

$$
\begin{align*}
& \varphi_{\mathrm{St}(n, p)}\left(W,-\operatorname{grad}_{W}^{\operatorname{St}(n, p)} f, t\right)= \\
& \varphi_{\operatorname{Gr}(n, p)}\left(W,-\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f, t\right) . \tag{31}
\end{align*}
$$

For analyzing the Newton's method, the notion of Hessian is important.

$$
\begin{equation*}
\operatorname{Hess}_{W} f(V, V)=\left.\frac{d^{2}}{d t^{2}} f(W(t))\right|_{t=0} \tag{32}
\end{equation*}
$$

where $W(t)$ is the geodesic starting from $W$ in direction to $W^{\prime}(0)=V$. From this definition, we get the following formulas [3]:
$\operatorname{Hess}_{W}^{\mathrm{St}} f\left(V_{1}, V_{2}\right)=f_{W W}\left(V_{1}, V_{2}\right)$

$$
\begin{align*}
& \left.+\frac{1}{2} \operatorname{tr}\left(\left(\nabla_{W} f\right)^{\top} V_{1} W^{\top}+W^{\top} V_{1}\left(\nabla_{W} f\right)^{\top}\right) V_{2}\right) \\
& -\frac{1}{2} \operatorname{tr}\left(\left(W^{\top} \nabla_{W} f+\left(\nabla_{W} f\right)^{t} W\right) V_{1}^{t}\left(I-W W^{t}\right) V_{2}\right) . \tag{33}
\end{align*}
$$

$f_{W W}\left(V_{1}, V_{2}\right)$ denotes $\sum_{i j, k l}\left(f_{W W}\right)_{i j, k l}\left(V_{1}\right)_{i j}\left(V_{2}\right)_{k l}$, where

$$
\left(f_{W W}\right)_{i j, k l}=\frac{\partial^{2} f}{\partial W_{i j} W_{k l}}
$$

$$
\begin{align*}
\operatorname{Hess}_{W}^{\operatorname{Gr}(n, p)} & f\left(V_{1}, V_{2}\right)= \\
& f_{W W}\left(V_{1}, V_{2}\right)-\operatorname{tr}\left(V_{1}^{\top} V_{2} W^{\top} \nabla_{W} f\right) \tag{34}
\end{align*}
$$

The assumption (24) allows us to set $W^{\top} \nabla_{W} f$ is symmetric, therefore for all $V_{1}, V_{2} \in T_{W} \operatorname{Gr}(n, p)$,

$$
\begin{align*}
& \operatorname{Hess}_{W}^{\operatorname{St}(n, p)} f\left(V_{1}, V_{2}\right)= \\
& \qquad \begin{aligned}
f_{W W}\left(V_{1}, V_{2}\right) & -\operatorname{tr}\left(W^{\top} \nabla_{W} f V_{1}^{\top} V_{2}\right) \\
& =\operatorname{Hess}_{W}^{\operatorname{Gr}(n, p)} f\left(V_{1}, V_{2}\right) .
\end{aligned}
\end{align*}
$$

[^0]In addition, for all $X \in T_{W} \operatorname{Gr}(n, p)$

$$
\begin{gather*}
\operatorname{tr}\left(\left(-\operatorname{grad}_{W}^{\operatorname{St}(n, p)} f\right)^{\top}\left(I-\frac{1}{2} W W^{\top}\right) X\right)= \\
\operatorname{tr}\left(\left(-\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f\right)^{\top} X\right)=g_{\operatorname{Gr}(n, p)}\left(-\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f, X\right), \tag{36}
\end{gather*}
$$

because $W^{\top} X=O$. Thus the formula for the inverse of the Hessian for the Grassmann manifold is reproduced from the one for the Stiefel manifold;
if $V_{1}$ is the solution of

$$
\begin{align*}
\operatorname{Hess}_{W}^{\mathrm{St}(n, p)} f\left(V_{1}, X\right)= & g_{\mathrm{St}(n, p)}\left(-\operatorname{grad}_{W}^{\mathrm{St}(n, p)} f, X\right) . \\
& \text { for all } X \in T_{W} \operatorname{St}(n, p), \quad \text { (3 } \tag{37}
\end{align*}
$$

it coincides with the solution $V_{2}$ of

$$
\begin{align*}
\operatorname{Hess}_{W}^{\operatorname{Gr}(n, p)} f\left(V_{2}, Y\right)= & g_{\operatorname{Gr}(n, p)}\left(-\operatorname{grad}_{W}^{\operatorname{Gr}(n, p)} f, Y\right), \\
& \text { for all } Y \in T_{W} \operatorname{Gr}(n, p) \tag{38}
\end{align*}
$$

(We assume $\mathrm{Hess}_{W}{ }_{W}^{\mathrm{St}(n, p)}$ and $\mathrm{Hess}_{W}{ }_{W}^{\mathrm{Gr}(n, p)}$ are nondegenerate.) Therefore

$$
\begin{gather*}
\varphi_{\operatorname{St}(n, p)}\left(W_{k}, \operatorname{Hess}_{W_{k}}^{\operatorname{St}(n, p)} f^{-1}\left(-\operatorname{grad}_{W_{k}}^{\operatorname{St}(n, p)} f\right), 1\right)= \\
\varphi_{\operatorname{Gr}(n, p)}\left(W_{k}, \operatorname{Hess}_{W_{k}}^{\operatorname{Gr}(n, p)} f^{-1}\left(-\operatorname{grad}_{W_{k}}^{\operatorname{Gr}(n, p)} f\right), 1\right) \tag{39}
\end{gather*}
$$

Lastly, we consider the conjugate gradient method. Let us denote the $k$-th updated point and the $k$-th updated search direction for the Stiefel and the Grassmann manifold by $W_{k}^{\mathrm{St}(n, p)}, H_{k}^{\mathrm{St}(n, p)}$, and $W_{k}^{\operatorname{Gr}(n, p)}, H_{k}^{\operatorname{Gr}(n, p)}$ respectively. Then

$$
\begin{align*}
& H_{0}^{\mathrm{St}(n, p)}=-\operatorname{grad}_{W_{0}}^{\mathrm{St}(n, p)} f= \\
& \quad-\operatorname{grad}_{W_{0}}^{\operatorname{Gr}(n, p)} f=H_{0}^{\operatorname{Gr}(n, p)} . \tag{40}
\end{align*}
$$

Our geodesic formulas (19)-(23) verify

$$
\begin{align*}
& W_{1}^{\operatorname{St}(n, p)}=W_{1}^{\operatorname{Gr}(n, p)}= \\
& \quad \exp \left(t_{\min }^{0}\left(H_{0}^{\operatorname{Gr}(n, p)} W_{0}^{\top}-W_{0}\left(H_{0}^{\operatorname{Gr}(n, p)}\right)^{\top}\right) W_{0} .\right. \tag{41}
\end{align*}
$$

We show the following: if $W_{k}^{\mathrm{St}(n, p)}=W_{k}^{\mathrm{Gr}(n, p)}$, and $H_{k}^{\mathrm{St}(n, p)}=H_{k}^{\mathrm{Gr}(n, p)} \in T_{W_{k}} \operatorname{Gr}(n, p)$, then $H_{k+1}^{\mathrm{St}(n, p)}=$ $H_{k+1}^{\operatorname{Gr}(n, p)}$ holds. We can easily get from our geodesic formulas (19)-(23) that

$$
\begin{align*}
& W_{k+1}^{\operatorname{St}(n, p)}=W_{k+1}^{\operatorname{Gr}(n, p)}= \\
& \exp \left(t_{\min }^{k}\left(H_{k}^{\operatorname{Gr}(n, p)} W_{k}^{\top}-W_{k}\left(H_{k}^{\operatorname{Gr}(n, p)}\right)^{\top}\right)\right) W_{k} \tag{42}
\end{align*}
$$

The assumption (24) gives

$$
\operatorname{grad}_{W_{k}}^{\mathrm{St}(n, p)} f=\operatorname{grad}_{W_{k}}^{\operatorname{Gr}(n, p)} f \text { and } \gamma_{k}^{\operatorname{St}(n, p)}=\gamma_{k}^{\operatorname{Gr}(n, p)} .
$$

Moreover, since

$$
\varphi_{\mathrm{St}(n, p)}\left(W_{k}, H_{k}^{\mathrm{St}(n, p)}, t\right)=\varphi_{\mathrm{Gr}(n, p)}\left(W_{k}, H_{k}^{\mathrm{Gr}(n, p)}, t\right)
$$

are geodesics, the parallel transportation vector of $H_{k}^{\mathrm{St}(n, p)}$ along $\varphi_{\mathrm{St}(n, p)}\left(W_{k}, H_{k}^{\mathrm{St}(n, p)}, t\right)$ to $W_{k+1}$ is equal to the velocity vector of $\varphi_{\mathrm{St}(n, p)}\left(W_{k}, H_{k}^{\mathrm{St}(n, p)}, t\right)$ at $t=t_{\text {min }}^{k}$. Therefore

$$
\begin{align*}
& \Pi_{\mathrm{St}(n, p)} H_{k}^{\mathrm{St}(n, p)} \\
& \quad=\left(H_{k}^{\operatorname{Gr}(n, p)} W_{k}^{\top}-W_{k}\left(H_{k}^{\operatorname{Gr}(n, p)}\right)^{\top}\right) W_{k+1}^{\operatorname{Gr}(n, p)} \\
& \quad=\Pi_{\operatorname{Gr}(n, p)} H_{k}^{\operatorname{Gr}(n, p)} \tag{43}
\end{align*}
$$

and so $H_{k+1}^{\mathrm{St}(n, p)}=H_{k+1}^{\operatorname{Gr}(n, p)}$ holds. Thus, by induction, it follows that $W_{s}^{\mathrm{St}(n, p)}=W_{s}^{\operatorname{Gr}(n, p)}$, and $H_{s}^{\mathrm{St}(n, p)}=$ $H_{s}^{\mathrm{Gr}(n, p)}, s=0,1,2, \ldots$

Note that the formulas for $\Pi_{\mathrm{St}(n, p)} H_{k}^{\mathrm{St}(n, p)}$, $\Pi_{\operatorname{Gr}(n, p)} H_{k}^{\operatorname{Gr}(n, p)}$ obtained in [3] are much more complicated and obscure the geometrical meaning.

More generally, we can extend the above result to a principal bundle and its base manifold. Let us consider a principal $G$-bundle $P$ over $M$, and denote the projection by $\pi: P \rightarrow M$. (For details of the principal bundle theory, the readers should refer to [4].) $\mathrm{St}(n, p)$ is a principal $O(p)$-bundle over $\operatorname{Gr}(n, p)$. We introduce a connection $\theta$ ( $\mathfrak{g}$-valued 1 form) on $P$. By using $\theta$, we decompose $T_{p} P$ into the sum of the horizontal space $H_{p}$ and the vertical space $V_{p}$. We endow $P$ with a $G$-invariant metric $g_{p}$ so that $H_{P}$ is orthogonal to $V_{P}$, and endow $M$ with the metric $g_{M}$ induced from $P$ :

$$
\begin{equation*}
g_{M}(u, v) \equiv g_{P}\left(u_{H_{P}}, v_{H_{p}}\right) \tag{44}
\end{equation*}
$$

where $u, v \in T_{m} M, u_{H_{P}}, v_{H_{p}}$ are lift of $u, v$ to $H_{p}$, $p \in \pi^{-1}(m)$. We assume a function $F$ to be optimized on $P$ has a $G$-symmetry in the sense that $F$ takes the same value on each fiber: $F\left(\pi^{-1}(m)\right)=$ const. In other words,

$$
\begin{equation*}
F(p \cdot g)=F(p), \text { for all } p \in P, g \in G \tag{45}
\end{equation*}
$$

Then the following holds:

$$
\begin{gather*}
\pi\left(\varphi_{P}\left(p,-\operatorname{grad}_{p}^{P} F, t\right)\right)=\varphi_{M}\left(m,-\operatorname{grad}_{m}^{M} f, t\right)  \tag{46}\\
\pi\left(\varphi_{P}\left(p, \operatorname{Hess}_{p}^{P} F^{-1}\left(-\operatorname{grad}_{p}^{P} F\right), 1\right)\right)= \\
\varphi_{M}\left(m, \operatorname{Hess}_{m}^{M} f^{-1}\left(-\operatorname{grad}_{m}^{M} f\right), 1\right)  \tag{47}\\
H_{k}^{P}=H_{k}^{M} \tag{48}
\end{gather*}
$$

where $H_{k}^{P}, H_{k}^{M}$ denote the search directions at $k$-th iteration for $P$ and $M$ determined by the conjugate gradient method (6). The proof proceeds like the same manner as the Stiefel and the Grassmann cases.

## 3. Conclusion

Exploiting our previously obtained geodesic formulas for the Stiefel manifold, we gave a unifying view on the Riemannian optimization methods on the Stiefel and the Grassmann manifolds. Instead of investigating the quotient space structure of the Grassmann manifold, we had only to take the symmetry of the target function into account and apply the formulas for the Stiefel manifold. This may give an insight for applying the Riemannian optimization methods to other homogeneous spaces.
